

Snabb-stopp på att junk används för subscription bombing.

The screenshot shows the Emacs-cl mailing list administration interface in a Mozilla Firefox browser. The page title is "Emacs-cl mailing list administration Privacy options... Section". The interface is divided into several sections:

- Configuration Categories:**
 - General Options
 - Passwords
 - Language options
 - Membership Management...
 - Non-digest options
 - Digest options
- Privacy options...:**
 - Subscription rules
 - Sender filters
 - Recipient filters
 - Spam filters
 - Bounce processing
 - Archiving Options
 - Mail<->News gateways
 - Auto-responder
 - Content filtering
 - Topics
- Other Administrative Activities:**
 - Tend to pending moderator requests
 - Go to the general list information page
 - Edit the public HTML pages and text files
 - Go to list archives
 - Logout

Below the navigation links, there is a section titled "Privacy options..." with a blue header. The text below the header reads: "This section allows you to configure subscription and membership exposure policy. You can also control whether this list is public or not. See also the [Archival Options](#) section for separate archive-related privacy settings."

The main content area is a table with two columns: "Description" and "Value".

Description	Value
Advertise this list when people ask what lists are on this machine? (Edit advertised)	<input type="radio"/> No <input checked="" type="radio"/> Yes
What steps are required for subscription? (Details for subscribe_policy)	<input checked="" type="radio"/> Confirm <input type="radio"/> Require approval <input type="radio"/> Confirm and approve
List of addresses (or regexps) whose subscriptions do not require approval. (Details for subscribe_auto_approval)	<input type="text"/>

A red arrow points to the "Confirm" radio button in the second row of the table.

Det är ju en administrativt jobbig åtgärd att godkänna subscriptions i vanliga fall. Men det får snabbt stopp på de utgående mailen. Då i princip inga riktiga requests förekommer får vi rensa manuellt tills vi får en captcha på plats.

Den sista (3:e) optionen fungerar ej då den också först genererar ett mail.

Om man vill ta bort listor istället så tror jag ändå vi skall börja med detta steget. Och sedan ta bort dem under ordnade former. Det finns andra redan halvt radera listor som orsakar andra typer av problem såsom många frozen mail.

Mvh Janderz
